DIABETES CONTROL

Introduction

Diabetes is a condition where your body is not able to control blood sugar levels properly. Either your body doesn't produce enough insulin or it cannot use it effectively.

Today, diabetes is increasing rapidly because of:

- Poor eating habits
- Lack of physical activity
- Stress and poor sleep
- Sedentary lifestyle (desk jobs)

The good news?
You can control it naturally with the right habits.

The earlier you take action, the easier it becomes to manage and even reverse pre-diabetes.

About the Author

Suraj Ambrale is a certified nutritionist and fitness coach with over 3+ years of experience in helping people transform their health naturally. He specializes in fat loss, lifestyle management, and guiding clients with conditions like diabetes through practical diet and workout strategies. His approach focuses on simple habits, consistency, and sustainable results rather than extreme methods. His goal is to help people build a lifestyle that they can follow for life.

Understanding Diabetes

Types:
Type 1: Body doesn't produce insulin
Type 2: Body doesn't use insulin properly (most common)
Pre-diabetes: Early stage, reversible

Causes:
Poor diet (high sugar & processed foods)
Lack of exercise
Obesity
Stress

Common Symptoms:
Frequent urination
Fatigue
Increased hunger
Blurred vision

Why Lifestyle Matters

Your daily routine directly affects your blood sugar.

- *Poor sleep* → increases sugar levels
-
- *Stress* → releases hormones that spike sugar
-
- *No movement* → body becomes insulin resistant

Simple rule: Move more, eat smart, sleep well.

Morning Routine for Diabetes Control

Start your day right:

- Wake up early (6–7 AM)
- Drink 1–2 glasses of water
- Go for a 10–20 min walk
- Do light stretching or mobility

Tip: Avoid checking phone immediately after waking up.

Diet Basics

A good diet is your strongest weapon.

Focus on:

- Protein: Eggs, paneer, chicken
- Fiber: Vegetables, oats, fruits
- Healthy fats: Nuts, seeds

Why sugar spikes happen?

- Eating refined carbs alone
- Skipping meals
- Overeating at once

Always combine carbs with protein.

Foods to Eat

Include these daily:

High-Fiber Foods:

- Oats
- Brown rice
- Vegetables

Protein-Rich Foods:

- Eggs
- Chicken
- Paneer
- Dal

Low GI Carbs:

- Sweet potato
- Whole grains

Tip: Plate should be 50% veggies + 25% protein + 25% carbs

Foods to Avoid

Avoid or limit:

- Sugar & sweets
- Cold drinks & packaged juices
- White bread & bakery items
- Fast food

Rule: If it’s processed, avoid it.

Workout Guide (Very Important)

Exercise is non-negotiable.

Strength Training:

- Builds muscle
- Improves insulin sensitivity

Walking:

- Best and simplest exercise
- Do after meals if possible

Cardio vs Weights:

- Both are important
- Mix them for best results

Beginner Plan:

- 3 days strength training
- 2–3 days walking/cardio

Sample Weekly Workout Plan

Monday: Upper Body + Walk

Tuesday: Walking (30 mins)

Wednesday: Lower Body

Thursday: Rest / Light walk

Friday: Full Body Workout

Saturday: Cardio (cycling/walking)
Sunday: Rest

Daily Routine Example

Morning: Walk + Healthy breakfast
Afternoon: Balanced lunch
Evening: Workout / Walk
Night: Light dinner (before 9 PM)

Try to eat meals at the same time daily.

Stress and Sleep Management

Stress increases blood sugar by releasing cortisol.

Manage Stress:

- Deep breathing
- Meditation
- Walking
-

Sleep:

- Minimum 6–8 hours
- Fixed sleep schedule
-

Poor sleep = poor sugar control

Common Mistakes

Avoid these:

Skipping meals
No exercise
Eating too much sugar
Crash dieting

Conclusion + Motivation

Diabetes control is not about perfection.
It's about consistency.

Small daily habits = Big long-term results.

Start simple:

- Eat better
- Move daily
- Sleep properly

Your health is in your hands.

Control your habits today, or your health will control you tomorrow.
